1. Introduction

POS Order Location is a small Odoo 19 add-on that records where each Point of Sale order was taken. When a cashier validates payment on the React Native POS register, the app captures the device's GPS coordinates and a human-readable place name, then writes them onto the order. Back-office staff can later see exactly where every sale happened, directly inside Odoo.

This is especially useful for mobile or field sales, delivery vans, pop-up stalls, and any operation where the same register moves between locations during the day.

1.1 What the module adds

- Three new fields on every POS order: Latitude, Longitude, and Location (the place name).
- A Location section on the POS order form in the Odoo back office, so you can review coordinates for any individual order.
- A Location column on the standard POS order list, which you can show or hide per view.
- A dedicated app menu, **POS Locations**, with an *Orders with Location* view that lists only the orders that actually captured a place name.

1.2 How location data is captured

The module itself stores data; it does *not* perform any geolocation. All capturing happens on the React Native POS register:

1. The cashier taps Validate Payment to complete a sale.
2. As soon as the order is confirmed in Odoo, the app reads the device's GPS position.
3. The app converts those coordinates into a readable place name on the device itself, using Expo's built-in reverse geocoding (no API key, no internet service charge).
4. The app writes the latitude, longitude, and place name onto the just-created POS order in Odoo.

NOTE Because reverse geocoding runs on the device, the Location field is filled only when the order is created from the React Native register and the device has granted location permission. Orders created directly on the Odoo desktop back office will have empty location fields.

1.3 Module summary

Property	Value
Technical name	<code>pos_order_location</code>
Display name	POS Order Location
Version	<code>19.0.1.0.1</code>
Category	Point of Sale
Author	Alphalizer Technologies
License	LGPL-3
Dependencies	<code>base</code> <code>point_of_sale</code>
Type	Application (appears in the Odoo app drawer)

2. Installation

Installing the module is a standard Odoo add-on deployment. You need administrator access to the Odoo server and to the Odoo database.

2.1 Prerequisites

- An Odoo 19 instance that you can administer.
- The Point of Sale application (`point_of_sale`) installed and configured.
- Server-level access to the Odoo add-ons directory, or permission to upload modules through the interface.
- The React Native POS register app, configured to connect to the same Odoo database (required for location data to actually be captured).

2.2 Deploy the module files

1. Stop the Odoo service before copying files, to avoid stale cached code:

```
net stop odoo
```

2. Copy the `pos_order_location` folder into your Odoo add-ons path. A typical Windows path looks like this:

```
C:\Program Files\Odoo 19\server\odoo\addons\pos_order_location
```

3. If you are replacing an earlier copy of the module, delete the old `pos_order_location` folder completely first, then copy in the fresh files. Do not merge folders.
4. Start the Odoo service again:

```
net start odoo
```

IMPORTANT On Windows, Odoo can keep running old code from cached bytecode files after an update. If the module behaves unexpectedly after an upgrade, stop the service, delete the module folder entirely, copy the fresh files, and only then upgrade from the Apps menu.

2.3 Install from the Apps menu

1. Log in to Odoo as an administrator.
2. Open the **Apps** menu.
3. Click **Update Apps List** (you may need to enable developer mode to see this option). Confirm the update.
4. Search for **POS Order Location**.
5. Click **Activate** (or **Install**) on the module card.

Odoo installs the module along with its dependencies. Once finished, a new **POS Locations** entry appears in the app drawer.

2.4 Verify the installation

After installation, confirm everything is in place:

- The **POS Locations** app appears in the main Odoo menu.
- Opening any existing POS order shows a **Location** section on the form (the fields will be empty for older orders).
- The POS orders list has a **Location** column available.

TIP If the POS Locations menu shows a generic placeholder icon instead of a custom one, that is expected. The module ships without an icon image, and Odoo simply uses a default tile. The menu still works normally.

3. The Location Fields

The module adds three fields to every POS order. They are filled in automatically by the React Native register and are read-only in the Odoo back office.

Field	Type	Description
Latitude	Number	The device's latitude at the moment Validate Payment was tapped. Stored with up to 8 decimal places for precision.
Longitude	Number	The device's longitude at the moment Validate Payment was tapped. Also stored with up to 8 decimal places.
Location	Text	A human-readable place name reverse-geocoded on the device, for example: "Sultan Qaboos Street, Muscat, Oman".

NOTE All three fields are read-only on the desktop. This is deliberate: location data is meant to reflect what the device actually recorded, so it cannot be edited from the back office. Corrections, if ever needed, must come from the source data.

4. Using the Module

Once installed, the module works quietly in the background. There is nothing to switch on per order. This section walks through where the location data shows up and how to work with it.

4.1 Capturing a location (on the POS register)

For the cashier, nothing changes in the checkout workflow:

1. Build the order and take payment as usual on the React Native POS register.
2. Tap Validate Payment.
3. The app captures the location automatically in the background. If location permission has been granted on the device, the place name also appears on the in-app receipt.

IMPORTANT If the device has not granted location permission to the POS app, the order is still created and payment still succeeds — but the location fields stay empty. Make sure location permission is enabled on each device that needs to record sale locations.

4.2 Viewing the location on a single order

1. Go to the **Point of Sale** app (or the **POS Locations** app).
2. Open any POS order.
3. Scroll down the order form to the **Location** section.

The section shows the **Location** place name on one side and the **Latitude / Longitude** coordinates on the other. All three are read-only.

4.3 Seeing locations across many orders

The standard POS orders list includes a **Location** column, placed right after the order date. It is shown by default, but you can hide or re-show it:

1. Open any POS orders list view.
2. Click the **column options** toggle at the top-right of the list (the small adjustments icon).
3. Tick or untick **Location** to show or hide the column.

4.4 The “Orders with Location” view

The module adds a dedicated **POS Locations** app to the drawer. Inside it, the **Orders with Location** menu opens a filtered list that shows *only* orders that actually captured a place name.

This keeps the view clean: orders created on the desktop back office (which never have GPS data) are automatically excluded, so you only see sales that came through the mobile register with location enabled.

1. Open the **POS Locations** app from the drawer.
2. Click **Orders with Location**.

3. Review the list. Click any row to open the full order with its Location section.

NOTE If this view is empty, it means no POS orders have captured a location yet. Check that orders are being created through the React Native register and that location permission is granted on the devices.

5. Troubleshooting

Most issues with this module come down to one of two things: location data was never captured on the device, or the module was not deployed cleanly. The table below covers the common cases.

Symptom	What to check
Location fields are empty on an order	Confirm the order was created on the React Native register, not the desktop back office. Confirm the device granted location permission to the POS app. Confirm the device had a usable GPS signal at the time of sale.
“Orders with Location” view is completely empty	No order has captured a place name yet. This is the same root cause as empty fields — check device permissions and that sales are flowing through the mobile register.
POS Locations menu is missing after install	Re-open the Apps menu and confirm the module shows as Installed. Run Update Apps List and try installing again. Refresh the browser; the app drawer is cached client-side.
Module behaves oddly right after an upgrade	This is usually stale cached code on Windows. Stop the Odoo service, delete the whole module folder, copy the fresh files, restart the service, then upgrade from the Apps menu.
POS Locations icon looks generic / placeholder	Expected behaviour. The module ships without an icon image, so Odoo shows a default tile. No action needed.
Coordinates look slightly off	GPS accuracy depends on the device and signal conditions. The module stores whatever the device reported; it does not correct or validate coordinates.

6. Frequently Asked Questions

Q. Does this module track the device continuously?

A. No. It records the location only once per order, at the moment payment is validated. It is not a live tracking tool.

Q. Can a cashier edit the location after the sale?

A. No. The Latitude, Longitude, and Location fields are read-only everywhere in the Odoo back office. They reflect what the device captured at sale time.

Q. Does reverse geocoding cost money or need an API key?

A. No. The place name is generated on the device itself using Expo's built-in reverse geocoding. There is no external service fee and no API key to manage.

Q. Will orders created on the Odoo desktop have a location?

A. No. Only orders created through the React Native POS register can capture location. Desktop-created orders will have empty location fields, which is why the "Orders with Location" view filters them out.

Q. What happens if location permission is denied on a device?

A. The sale still completes normally. Only the location fields are left empty for those orders.

Q. Does the module work without the Point of Sale app installed?

A. No. It depends on the point_of_sale module and extends the POS order record. Point of Sale must be installed first.

Q. Is the data visible to all users?

A. The location fields follow the same access rules as the rest of the POS order. Anyone who can view a POS order can see its location section.

Appendix A: Quick Reference

Where to find things

I want to...	Go to
See the location of one order	Point of Sale → open the order → Location section
Scan locations across many orders	Any POS orders list → Location column
See only orders that captured a location	POS Locations app → Orders with Location
Show or hide the Location column	POS orders list → column options toggle (top-right)
Reinstall or upgrade the module	Apps menu → search “POS Order Location”

Deployment commands (Windows)

```
:: stop the Odoo service before swapping module files
net stop odoo

:: (delete the old module folder, copy in the fresh one)

:: start the service again
net start odoo
```

At a glance

Item	Detail
Module	<code>pos_order_location</code>
Version	<code>19.0.1.0.1</code>
Fields added	Latitude, Longitude, Location
Editable in back office?	No — all three fields are read-only
Data source	React Native POS register, at Validate Payment
Depends on	<code>base</code> , <code>point_of_sale</code>
